

Ecological Conservation ♦

Allah Almighty has created this world to be inhabited by human being. He has also created conditions conducive to make it comfortable. But some of these things cause pollution. The Lord of this universe has also created means that work to dissolve the pollution and save human kind from the injurious effects of this pollution through this process. After dissolution these elements cause improvement to the natural system of this universe. There is no doubt that the industrial revolution has provided ample comforts of life to humankind but at the same time it has caused extraordinary air, water and sound pollution. It has affected the equilibration of weather. All sort of diseases have cropped up. The scientists are of the view that if it was not controlled the consequences will be disastrous for the humanity. The science has also suggested the ways to absorb the elements of pollution. But to get maximum production through minimum expenditures the industrialists are not making use of it. It is some thing despicable in term of Islamic and humanistic values.

The following resolutions are adopted in this perspective:

- 5.1 It is incumbent upon the industrialists that if they go for an industry that causes pollution they must use the means that could dissolve the pollution, to avoid detriment to the environment and thereby save humanity from the adverse effects of pollution.
- 5.2 The advent of multinational companies no doubt, is advantageous from some aspects as there is competition in the market and consumers get better quality products but these industries have brought along with them the industrial wastage and various kinds of pollutions. This seminar therefore demands the govt. of India that all the companies whether national or multinational must be made liable to abide by the laws enacted to keep the environment pollution free.
- 5.3 The dangers the world is faced with due to environmental pollution are mostly from the developed countries. To earn more and more profit and to get cheapest products, they did not care to make their industries environment friendly, nor did they use the means to dissolve pollution, so much so that now when the pollution has become a formidable threat, they are unwilling to own their responsibility. This seminar urges them to be alive to their responsibilities towards humanity and appeals to the government of India that being the largest democracy of the world and a major world power it should try to make the developed countries to shoulder their responsibilities.

5.4 All the country men are also urged to keep their environment pollution free. They must avoid to do anything that cause pollution in their localities and is vexatious to others such as to answer the call of nature in the open, to make open drains out of ones house, to throw dirt or filth in the stored clean water, etc. It will save the society from dangerous diseases and other detriment.
